

1. Introduction

In Part 2, I improved the design and visual presentation of my THAGWIS AI MECHANIC website by implementing an external CSS stylesheet called style.css. I maintained the original five-page structure, consisting of the Home, About Us, Services, Enquiry, and Contact pages. External CSS lets one stylesheet link to multiple HTML pages, supporting consistency and easier maintenance (MDN Web Docs, n.d.-a).

2. Website Updates

2.1 External CSS Styling

I connected the style.css file to the five HTML pages using the <link> element. I used CSS to control the website's colours, fonts, spacing, backgrounds, borders, shadows, and layout. This improved the consistency of the website because common styling rules could be applied across multiple pages using one external stylesheet (MDN Web Docs, n.d.-a).

2.2 Header and Navigation

I improved the header by introducing a dark blue gradient background, a centred company logo, and a more prominent company name. I also styled the navigation bar by adding spacing, rounded links, hover effects, and an animated underline. The navigation bar was made sticky so that it remains visible while the user scrolls through the website.

These changes improve the visual organisation of the website and make the navigation easier to use.

2.3 Homepage and Featured Services

I improved the homepage by styling the hero section, headings, images, and call-to-action links. I added consistent image sizing, rounded corners, and shadows to improve the visual presentation.

I also changed the appearance of the Featured Services list by using CSS Grid and card-style layouts. Each service card includes spacing, borders, blue accent colours, and hover effects. This allows the services to be presented in a structured and readable manner.

2.4 Why Choose THAGWIS AI MECHANIC

I redesigned the “Why Choose THAGWIS AI MECHANIC?” section using numbered benefit cards. CSS counters were used to display numbers in circular icons, while spacing, borders, and hover effects were added to improve the presentation.

This change makes the list easier to scan and gives the section a more organised appearance.

2.5 About Us and Services Pages

I improved the About Us page by styling the company information, mission, vision, and team sections. I also applied consistent formatting to headings, paragraphs, and images.

On the Services page, I styled the service descriptions as professional cards and improved the appearance of the service images. These changes help maintain a consistent visual identity across the website.

2.6 Enquiry and Contact Forms

I improved the Enquiry and Contact forms by styling the input fields, labels, text areas, and buttons. I added padding, borders, rounded corners, focus effects, and hover effects to the form controls.

CSS provides styling techniques for form elements such as text inputs, text areas, labels, and buttons, which can be used to create a more consistent interface (MDN Web Docs, n.d.-b).

2.7 Responsive Design

I added media queries to make the website more responsive on smaller screens, including mobile phones and tablets. The CSS adjusts the navigation, service cards, image heights, form fields, and buttons according to the screen size.

Responsive web design allows websites to adapt their layouts to different screen sizes, while media queries apply specific CSS rules based on viewport characteristics (MDN Web Docs, n.d.-c).

2.8 Footer Improvements

I improved the footer on all five pages by adding a dark background, contrasting text, a blue top border, and consistent spacing. The footer contains the company name, contact information, tagline, and copyright details.

This creates a consistent appearance across the website and ensures that important contact information is presented in a structured way.

3. Summary

In Part 2, I improved the THAGWIS AI MECHANIC website by implementing external CSS styling. The main improvements included the header, navigation bar, homepage, service cards, About Us page, forms, footer, and responsive layout.

I retained the original five-page structure while improving the website's visual consistency and usability. Using an external stylesheet also makes it easier to maintain and update the design across multiple pages (MDN Web Docs, n.d.-a).
